EXPERIMENT 7: INTEGRATING A ZOHO CREATOR APPLICATION WITH ANOTHER ZOHO SERVICE USING CONNECTIONS AND APIs

Aim

To integrate the existing **Insurance Claim Application** in Zoho Creator with Zoho CRM using an authenticated connection and an automated workflow, enabling claim details to be transferred to CRM after successful form submission.

Procedure

1. Application Setup: Open the existing Insurance Claim Application in Zoho Creator. Use the current application rather than creating a duplicate.

2. Form Details: Use the existing fields: Claimant Name, Claimant Type, Policy Number, Email Address, Contact Number, Residential Address, Claim Type, Date of Incident, Claim Amount Requested, Incident Description, and Supporting Documents.

3. Connection: In Microservices, choose **+ Create New**, select Connections and choose Zoho CRM if available. Configure the connection, authorize the requested access, and verify that it is available.

4. Workflow: Create a workflow for the existing claim form that runs when a new record is created/submitted.

5. CRM Action and Mapping: Add a Zoho CRM integration action using the connection. Select a suitable CRM module and map the corresponding claim fields, such as Claimant Name, Policy Number, Email, Contact Number, Claim Type, Incident Date, Claim Amount Requested, Incident Description, and Claim ID.

6. Test: Save and enable the workflow. Submit a test claim and verify the mapped record in Zoho CRM.

Result

The Insurance Claim Application is integrated with Zoho CRM through an authenticated connection and a record-submission workflow. After completing the connection, field mapping, and test submission, claim details can be synchronized to the selected CRM module.
